

Smart Lesson Builder — User Management

All of this runs in **Supabase** → **SQL Editor** (set the dropdown to **No limit**).

Creating accounts requires Supabase project access. Being an admin *inside* Smart Lesson Builder is not enough — that's deliberate.

One-time: run `supabase/migrations/create_user_function.sql` once, or none of this works.

Add a user

```
-- creates them as a builder
select public.create_slb_user('person@thinkcerca.com', 'TempPassword123!');

-- or pass a role: 'builder' | 'designer' | 'admin'
select public.create_slb_user('person@thinkcerca.com', 'TempPassword123!', 'admin');
```

Builder is the default — two arguments is all you need for a normal user.

Tell them: *sign in at smart-lesson-builder.vercel.app with this temporary password; you'll be asked to choose your own.*

Reset a password

```
update auth.users
set encrypted_password = extensions.crypt('TempPassword123!', extensions.gen_salt('bf')),
  raw_user_meta_data = coalesce(raw_user_meta_data, '{} '::jsonb)
  || '{"password_set": false}'::jsonb,
  updated_at = now()
where email = 'person@thinkcerca.com';
```

Both lines matter — the second is what makes them pick a new one.

Delete a user

```
delete from public.profiles
where id = (select id from auth.users where email = 'person@thinkcerca.com');

delete from public.allowed_signup_emails
where email = 'person@thinkcerca.com';

delete from auth.users
where email = 'person@thinkcerca.com';
```

All three, in this order. `0 rows` on the first is fine.

Change a role

```
update public.profiles
set role = 'admin', updated_at = now()
where id = (select id from auth.users where email = 'person@thinkcerca.com');
```

Errors

`create_slb_user does not exist` → run the migration file.

`extensions.crypt does not exist` → create extension if not exists `pgcrypto` with schema `extensions`;

`Signups not allowed` → expected, accounts come from here only.
